

DISPERGAN S3

CONCENTRATED DISPERSING/PENETRATING AUXILIARY

CHARACTERISTICS

<i>Appearance:</i>	<i>beige powder</i>
<i>pH in solution at 10%:</i>	<i>7,5 - 8,5</i>
<i>Solubility:</i>	<i>soluble</i>

PROPERTIES

DISPERGAN S3 is powder dispersing penetrating agent, with high concentration, very soluble in warm and cold water, developed to dye chrome and vegetable leathers, in presence of acid dyestuffs or basic dyestuffs used as topping.

In the specific case of semi-chrome tannage, it is particularly advantageous because the chrome-tanned leather retanned with **DISPERGAN S3** does not lose its characteristics, contrary to what happens in retanning with vegetable tannins; moreover, topping carried out with basic dyestuffs will provide deeper and vivid colours.

USAGE METHOD

0,5% - 1% in chrome tanning.

1% - 2% in vegetable tanning.
