

DISPERGAN S4

DISPERSIVE AUXILIARY FOR HIDES

CHARACTERISTICS

<i>Appearance:</i>	<i>brown powder</i>
<i>pH in solution at 10%:</i>	<i>7 – 8</i>
<i>Solubility:</i>	<i>soluble</i>

PROPERTIES

DISPERGAN S4 is a highly concentrated dispersing penetrator in powder form, very soluble in hot and cold water. It is recommended for the dyeing of leather, both chrome and vegetable, whether in the presence of acid colourants or basic colourants used in the remounting process. In the specific case of semi-chrome tanning, it has an advantageous use because the chrome-tanned hide and retanned with **DISPERGAN S4** does not lose its particular characteristics, like it does when retanning is effectuated with vegetable tannins. Furthermore, remounting effectuated with basic colourants gives a deeper and more lively dyeing.

USAGE METHOD

0.5% to 1% is used in chrome tanning.

1% to 2% is used in vegetable tanning.
