

ELCATAN G

RETANNING/NEUTRALISING TANNIN

CHEMICAL COMPOSITION

Product based on phenol and buffered salts

CHARACTERISTICS

Appearance: beige powder

pH in solution at 10%: 7 – 8

PROPERTIES

ELCATAN G is an anionic retanning agent with a strong neutralising and buffering effect.

ELCATAN G is a neutral retanning agent and is preferably used after chrome retanning. It is a product for neutralising and dyeing chrome tanned skins, chrome compounds and other mineral tannings.

ELCATAN G allows very soft and full skins to be obtained, according to the quantity of the product used.

ELCATAN G has excellent power in making the colourants penetrate into sections in even tones, a quality which is much appreciated on heavy hides and especially Nubuk. It can be used singularly or combined with neutralising salts, such as formats and bicarbonates.
