

ELCATAN PAK

TANNIN FOR RETANNING/NEUTRALISING

CHEMICAL COMPOSITION

Napthaline-sulphonic based product with buffered salts

CHARACTERISTICS

Appearance: clear powder

pH in solution at 10%: 7 - 8

PROPERTIES

ELCATAN PAK is an anionic retanning powder with a strong neutralising and buffering effect.

ELCATAN PAK is a neutral retanning powder that is preferentially used after chrome retanning. It is a product for neutralisation and the dyeing of chrome tanned, chrome complex leathers and other mineral tannings.

ELCATAN PAK assists in obtaining very soft and full leathers, according to the quantity of product used. It has an optimum power of making the colourants penetrate into the sections in a uniform tone; a quality that is much appreciated on heavy leathers and in particular on nubuck. It can be used on its own or in combination with neutralising salts, such as formates and bicarbonates.
