

## SCIVOLANTE MGL

*LIQUID SLIPPING PRODUCT FOR LEATHER*

### CHARACTERISTICS

*Appearance:* viscous light-blue coloured liquid

*pH in solution at 10%:* 6,5 – 7,5

### PROPERTIES

The liquid **SCIVOLANTE MGL** is a slipping agent that, added during the working of the skins in barrel, increases the viscosity of the liquids, thus decreasing the friction and the rubbing due to the mechanical action.

The use of the liquid **SCIVOLANTE MGL** can be advantageous in the following cases:

- To decrease the lowerings of the grain due to the mechanical action during the workings of vegetable tannage, vegetable retannage and with synthetics on chrome and dyeing both on chrome- and vegetable tanned leathers, especially when you work on large lots, when the rotations last long and when you work in brief baths.
- To avoid knotting, tearing and folding when working on sides, thin skins for garment and furniture.
- In the quick upper and kip tannage to avoid lowerings of grain, foldings and the too fast increase of temperature.
- To facilitate the emptying of the barrel.

Therefore, the tanneries, that want to avoid annoying dust emissions by the traditional slipping agents and residues in the emptying of the drums, use successfully the liquid **SCIVOLANTE MGL**.
